Requirements for revisions/ updates of safety data sheets

Issue: December 2014

According to (EG) Nr. 1907/2006 (Reach-Compliance), Art. 31 Chapter 9 (European regulations), a safety data sheet has to be revised/updated as soon as:

- a) „new informations with (possible) impacts on risk management actions or new informations on hazardous events become available;**
- b) permissions being granted or retracted;**
- c) a restriction has been issued.“**

Only the above mentioned changes legally require an updated issue of a safety data sheet to all users who received the affected product within the last 12 month. In addition an within regular intervals - depending on possible hazardous effects of the product - the safety data sheets are being reviewed by proficient persons. Should any significant changes are herewith necessary our customer will immediately receive the updated safety data sheet through his provider.

Updated safety data sheets are clearly marked on its initial page containing the date of issuing as well as the revision date. Additionally the version number with the validity date is part on the primary page of the safety data sheet. In chapter 16 of the same safety data sheet a notice will be served explaining the reasons which changes made the update necessary as well as a definition of the affected positions or sites.
